AI-First Document Management System

Electronic Document Management System that feels instant — and stays private

MPSDocs is an AI-powered enterprise document management system designed to automate document-heavy processes while ensuring high standards of privacy and security. It uses technologies such as OCR, LLMs and AI to analyze, extract, and automate data. Offering both standard cloud and on-premises deployments, the system is aimed at solving a variety of organizational needs.

Overview

Everything you expect from an EDMS — plus the intelligence layer.

Automates the entire document lifecycle, from creation to archiving, to improve efficiency, speed and security. By replacing manual processes, paper, or unstructured files, the system helps organizations reduce human error, reduce costs, and improve overall system reliability.

Design

Keep data inside. Still get automation.

MPSDocs gives you a choice - standard cloud for fast scaling, or a true on-prem enterprise deployment. In an on-prem setup, the platform and the storage, indexing and metadata, OCR, and most importantly the AI module run insight on your own servers, ensuring that all data and traffic remain entirely within your own infrastructure, behind your firewall.

Platform

Web-based platform with multi language interface. Central document repository with statistics and system metrics.

Collaboration

Version control, Check-in / Check-out, comments, internal messaging, event notifications, object events subscription and more.

Security

Role-Based and ACLs First. Every access and change can be tracked and exported to satisfy internal and external audits.

AI automation and OCR

Turn scans into searchable and structured information. Automatic metadata extraction, type and metadata classification, document name change.

Elastic full-text search

Search in entire repository, document name, content, metadata, summary, comments, history. Complex Filters for up to 100% accuracy.

Context understanding

Understand intent and meaning across OCR and AI. Build rules from context and synthesize a short summary from the entire document.

Intelligent workflows

Create intelligent routing, approvals, exception handling and enrichment. Moving from manual to automated workflows can reduce time and errors.

Scaling from teams to enterprises

Start in the cloud per seat. Upgrade and automate when governance and deployment requirements grow.

Fully on-premises with AI modules that work entirely locally for maximum privacy.

MPS DOCS Lite

Cloud PaaS

Entry Point: Without AI module

Manual Date Input

Launch in minutes, scale by seats, keep teams aligned with permissions. OCR on board but no AI module and automation. Users enter the date into type and metadata fields manually.

MPS DOCS Standard

Cloud PaaS

Entry Point: All modules in cloud

Fully Automated

A dedicated cloud environment with AI module, designed for stricter governance and tailored integrations. Private automated tools populate the type and metadata fields.

MPS DOCS Enterprise

On-Premise

Entry Point: All in your building

Data sovereignty

Storage, search, OCR and AI modules run on-site. No external model calls. Data never leaves your building. All data and the AI module are under full control behind your own firewall.

THANK YOU

**See MPSDocs on your
documents with your policies.
Talk to sales or architecture.**

We'll walk through workflows, training AI module, OCR accuracy, search, ACL and the on-prem architecture. Leave with a clear deployment plan for your environment.
